

Do You Know How Your Oil Platform Is Doing?

THE REAL QUESTION

What we actually mean is "Can you check the condition of your remote industrial resources at any time? In pictures?"

Your answer:

- a) Check?
- b) No, I do not worry about my investment!
- c) Yes, if I drive for two hours, fly for two hours, again drive and then take a photo.

IF YOU HAVE ANSWERED:

- a) Yes you can. Call us. We can help.
- b) Please, try again. This time, take reality into account.
- c) That'll do. But there must be an easier way.

If you have answered c), then you are on the right path. Although all that travelling may become a bit tiring after a while. So, whether you are running an oil rig in Alberta, a mine in northern Manitoba, power plant in Ontario or oil platform on the Atlantic coast, you can still have close contact with your operation. Connect your resources to yourself. Connect your employees to the world.

How can you make that happen?

That's where we can help you. We will put everything together for you. We will enable your employees to have high speed internet connection at their remote work location. We will enable you to check up on your resources without a need to actually be there. How can we do all that? The answer is simple. Satellite.

THE REAL ANSWER

Two-way satellite connection.

So simple, yet so efficient. After years of perfecting the technology, finally the industrial strength solution is available for satellite-based internet connectivity.

In partnership with C-COM Satellite Systems and Hughes Networks, we offer you a peace of mind. For flexibility, availability and convenience we offer you a consistent internet connectivity solution that does not depend on a location.

Two-way satellite based internet connection
